

SANKET JANGER

sjanger@binghamton.edu | [LinkedIn](#) | [GitHub](#) | [Portfolio](#) | Binghamton, NY | (609) 302-1913 | CPT/OPT Eligible

TECHNICAL SKILLS

Languages: Python, TypeScript, SQL, HTML/CSS

Frameworks & Libraries: React, Next.js, FastAPI, Flask, Vite

Messaging/Streaming: RabbitMQ, WebSockets, event-driven systems

Datastores: PostgreSQL, Redis, BigQuery, Supabase

Cloud & DevOps: GCP (Pub/Sub, Cloud Functions, Cloud run, BigQuery), Docker, Git, CI/CD

AI/Developer Tools: Cloudflare Workers AI, LLM APIs, Claude Code, GitHub Copilot, Cursor

EXPERIENCE

Software Development Intern, Global Health Impact Project, Binghamton, NY May 2025 – August 2025

- Enabled multi-variable disease forecasting by implementing DALY-based Impact Score computations and four analysis views across Country, Drug, Disease, and Company in an internal Flask and React tool.
- Identified a discrepancy between Impact Score outputs and the project's reference mapping, traced it to calculation logic, and created worked examples that helped the team correct the production model.

PROJECTS

GrindMate | TypeScript, React, Vite, Cloudflare Workers AI, Durable Objects, GitHub OAuth [\[GitHub Link\]](#)

- Built an LeetCode practice companion with a TypeScript/React frontend and Cloudflare Workers backend, integrating GitHub OAuth and Durable Objects to persist user-specific problem history across sessions.
- Implemented spaced-repetition scheduling with **Durable Object Alarms** and built a Recharts dashboard to track solve rate, time per problem, and topic mastery across DSA categories.

GCP Usage Analytics Pipeline | Python, GCP Pub/Sub, Cloud Functions, BigQuery, Looker Studio [\[GitHub Link\]](#)

- Built an event-driven pipeline on GCP using Pub/Sub for real-time event streaming of UI interactions and API metrics into BigQuery, 2,000+ events processed with under 2 seconds end-to-end latency, table partitioned by date and clustered by component for cost-efficient queries.
- Exposed the pipeline as a REST API on Cloud Run with auto-alerting when error rate crosses 30% and a live Looker Studio dashboard showing real-time event volume and API latency distributions.

OrderFlow | FastAPI, Redis, RabbitMQ, PostgreSQL, Next.js, Docker [\[GitHub Link\]](#)

- Built a distributed, event-driven order processing system with FastAPI, RabbitMQ, and PostgreSQL where sync and async workers handle the critical path (cart validation, inventory reservation with row-level locking, payment processing with exponential backoff) and background jobs in parallel. Processed 10 concurrent orders with 100% fulfillment and 0 messages lost to the dead letter queue.
- Added real-time order tracking using Redis pub/sub and WebSocket where every status change (validating, payment processing and confirmed) pushes instantly to the browser without polling. Clean orders confirm in 3.6 seconds end to end, with 4 async background jobs firing in parallel the moment payment succeeds.

EDUCATION

Binghamton University, The State University of New York, Binghamton, NY Expected December 2026

Master of Science in Computer Science (AI Track)

Relevant Coursework: Design Patterns, Design and Analysis of Algorithms, Cloud Computing, AI/ML

Savitribai Phule Pune University, Pune, India

June 2024

Bachelor of Engineering in Computer Engineering, Honors in Data Science
